 AB - KR2003010390 NOVELTY - An apparatus for sharing power amplification of a base station and a method thereof are provided to utilize idle resources of neighboring sectors when an error is generated in a power amplifier of a specific sector, thereby improving the communication quality of a mobile telephone.
 - DETAILED DESCRIPTION - A distributing part(20) distributes RF signals received by sectors of a base station cell and includes the first sharing part(21) amplifying power at neighboring sectors by distributing the received RF signals. A power amplifying part(30) amplifies power of the RF signals distributed from the distributing part(20) to a regular level. A combination part(40) combines the power-amplified signals at the power amplifying part(30) and includes the second sharing part(41) combines the power-amplified RF signals of the neighboring sectors.
